## Research Background

In view of the outbreak of Novel Coronavirus (aka "Wuhan Pneumonia") in late January 2020, the Hong Kong Public Opinion Research Institute (HKPORI) kick-started the "Community Democracy Project: Community Health Module" or "Community Health Project" by PopPanel survey study and community-based analysis, in order to understand the public's views on the epidemic and the Government's relevant policies, using small communities such as housing estates as the unit of analysis. The survey covers people's views on their perceived chance of contracting pneumonia, appraisal on the government's handling of the disease, impacts of the border closure, and calls for strike by frontline medical staff, etc. The special feature of Community Health Module is that the lower age bracket of target respondents is set at 12 years, in order to achieve a more comprehensive sample.

In response to the latest development of the Wuhan Pneumonia, HKPORI since February 2020 has introduced the "Community Health Information System," (CHIS) to reprocess data collected from the Community Health Project within the past 15 days that are related to the reserve of protective masks, the need for anti-epidemic commodities and mask usage, with the aid of geographic information systems to display data for each constituency area. Unlike general opinion questions, the data of the CHIS comes from all samples of the Hong Kong People Representative Panel and Hong Kong People Volunteer Panel within a certain survey period, and not adjusted by any weighting.

The CHIS data is processed and presented in the following manner:

1. The samples from "Hong Kong People Representative Panel" and "Hong Kong People Volunteer Panel" who responded to the questions of "mask reserve" and "demand for anti-epidemic commodities" are first screened for the past 15 days;
2. The question on "mask reserve" is then processed as follows:
  - a. Calculate and pair up the mean values of "mask reserve" for individual constituency areas, then divide all values into 6 groups according to the natural breaks classification method of geographic information systems (GIS) designed for easy appreciation by the general public, with specific separation values and representations by different colors in the map, to reflect the relative scarcity and abundance of mask reserve in that area. The colors used for the six intervals are as follows:
    - First interval: red
    - Second interval: orange
    - Third interval: yellow
    - Fourth interval: green
    - Fifth interval: turquoise
    - Sixth interval: blue
  - b. If the valid sample from a certain constituency area is less than 30, the information is treated as "missing" and no colour pairing will be made or displayed.
3. The question on "demand for anti-epidemic commodities" is processed as follows:
  - a. In each constituency area, calculate the number of people who need each "anti-epidemic commodity", namely:
    - i. Face mask
    - ii. Hand sanitizer
    - iii. Ethyl alcohol
    - iv. Bleach
    - v. Disinfectant wipes
    - vi. Disinfectant spray
    - vii. Hand wash
    - viii. Antiseptic disinfectant

- ix. No need at all
  - b. Calculate the sample size of each constituency area, divide "number of people who need each anti-epidemic supply" by the sample size of that area to obtain a percentage, then use the same classification method and color scheme explained before to show people's relative demand on various commodities in that area.
  - c. If the valid sample from a certain constituency area is less than 30, the information is treated as "missing" and no colour pairing will be made or displayed.
4. For detailed interval values, please refer to Appendix 1.
